

Here's a clean, structured survey document based on your uploaded papers. I carefully selected 5 papers of easy-moderate complexity (avoiding overly mathematical ones) and unified them into a coherent, top-per-level report ready for PDF conversion.

Survey on Plagiarism Detection and Text Similarity Techniques

1. Introduction

Plagiarism detection has become a critical challenge in academic and digital environments due to the increasing availability of online content and advanced paraphrasing techniques. Traditional methods based on surface-level text matching are no longer sufficient, leading to the development of hybrid, semantic, and structural approaches.

This survey reviews five research papers that explore different techniques for plagiarism detection and text similarity, ranging from n-gram models to semantic embeddings and machine learning approaches.

Paper 1: Lexical-Semantic Hybrid with SVM

Paper Title & Authors:

"Plagiarism Detection in English Academic Documents using a Lexical Semantic Hybrid and Support Vector Machine"

Callista Virginia, Derry Alamsyah

Research Objective:

To improve plagiarism detection by combining lexical similarity (word overlap) and semantic similarity (contextual meaning).

Methodology:

TF-IDF, SBERT, hybrid features, SVM, PAN dataset

Key Findings:

92.5% accuracy, detects paraphrasing

Summary:

Hybrid model combining lexical and semantic features.

Paper 2: Word-Length n-Grams

Paper Title & Authors:

“Word Length n-Grams for Text Re-use Detection”

Alberto Barrón-Cedeño et al.

Research Objective:

Reduce computational complexity.

Methodology:

Word length encoding, n-grams, trie

Key Findings:

Reduced memory and time

Summary:

Efficient large-scale detection

Paper 3: Stop Word n-Grams

Paper Title & Authors:

“Plagiarism Detection in Text Documents using Sentence Bounded Stop Word N-Grams”

Deepa Gupta et al.

Research Objective:

Detect intelligent plagiarism

Methodology:

Stop words, n-grams, POS tagging

Key Findings:

Works for paraphrasing

Summary:

Structure-based detection

Paper 4: Intrinsic Detection

Paper Title & Authors:

“Intrinsic Plagiarism Detection using N-gram Classes”

Imene Bensalem et al.

Research Objective:

Detect without sources

Methodology:

Character n-grams, classification

Key Findings:

Detects style changes

Summary:

Intrinsic detection method

Paper 5: Semantic Similarity (BERT)

Paper Title & Authors:

“Computational Analysis of Semantic Connections Between Herman Melville’s Reading and Writing”

Nudrat Habib et al.

Research Objective:

Detect semantic similarity

Methodology:

BERTScore, embeddings

Key Findings:

Captures deep meaning

Summary:

Advanced semantic detection

Consolidated Summary

Evolution from n-grams to semantic models. Hybrid approaches best.

Conclusion

Hybrid and semantic models are future of plagiarism detection.
